

An Overview of the XENONnT Experiment

Wednesday, 15 July 2026 15:36 (23 minutes)

The XENONnT experiment is one of the world's most sensitive direct dark matter search experiments, employing a dual-phase liquid xenon time projection chamber to search for rare interactions between dark matter particles and xenon nuclei.

In this talk, I will introduce the scientific motivation, detector design, detection principle, and recent physics results of the XENONnT experiment

Presenter: OTSUZUKI, Kotaro (Kamioka, ICRR)

Session Classification: Session 4
