

The calibration of the photo-detector module of the EUSO telescope

Thursday, 29 October 2015 14:40 (15 minutes)

The photo-detector module (PDM) of the EUSO is composed of 36 Hamamatsu multi-anode photomultipliers (64 channels per tube), and 36 photon counting readout ASICs, for a total of 2304 channels. We present the calibration of the detection efficiency of the PDM.
