

Lens manufacturing for the near future missions of ultra high energy cosmic rays

Thursday, 29 October 2015 14:55 (15 minutes)

We present the lens manufacturing for the near future missions of ultra high energy cosmic rays. The EUSO ultra long duration balloon flight mission and the K-EUSO project have been planned. The balloon optics is composed of two Fresnel lenses and a diffractive lens. The K-EUSO optics is composed of a primary aspherical mirror and a Fresnel lens as a corrector lens. RIKEN will provide Fresnel lenses for both projects.
