Heliospheric modulation (distortion) in MHD model heliosphere

Phase-space density of CRs: $f(\mathbf{r}, \mathbf{p}, t)$

$$Df = \frac{\partial f}{\partial t} + \frac{d\mathbf{r}}{dt} \cdot \frac{\partial f}{\partial \mathbf{r}} + \frac{d\mathbf{p}}{dt} \cdot \frac{\partial f}{\partial \mathbf{p}} = \left(\frac{\partial f}{\partial t} \right)_c \approx 0$$

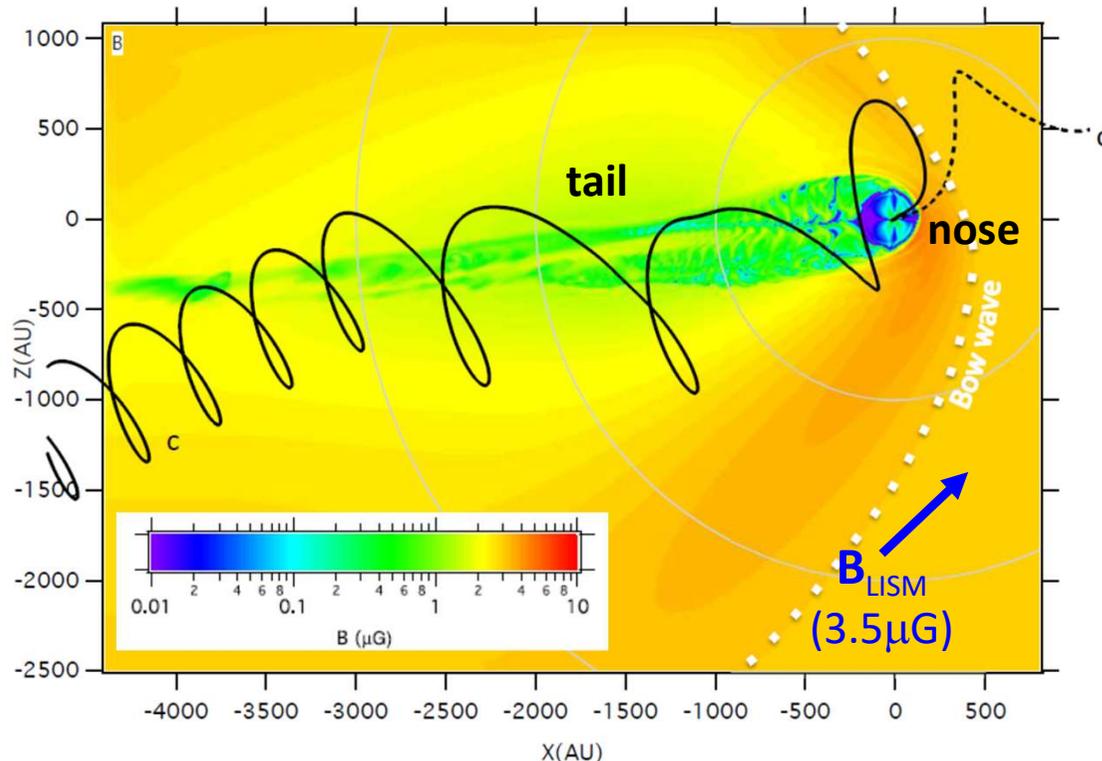

$$\frac{d\mathbf{p}}{dt} = Ze \left(\mathbf{E} + \frac{d\mathbf{r}}{dt} \times \mathbf{B} \right)$$

$$f(\mathbf{r}_E, \mathbf{p}_E, t) \approx f(\mathbf{r}_B, \mathbf{p}_B, t)$$

➤ Obtain model $f(\mathbf{r}_B, \mathbf{p}_B, t)$ best-fit to the observed $f(\mathbf{r}_E, \mathbf{p}_E, t)$.

➤ We use MHD heliosphere by *N. Pogorelov* for CR orbit calculation.

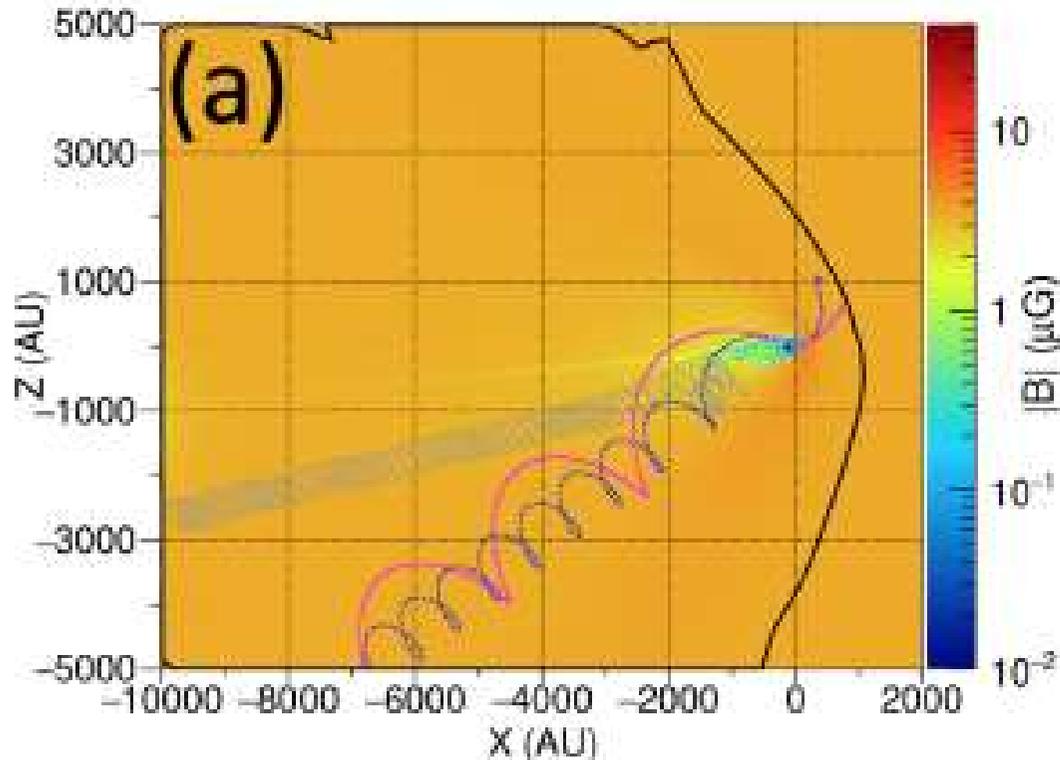

➤ Take accounts of composition, E-spectrum and AS-array performance for quantitative best-fitting.

Model: $f(\mathbf{r}_B, \mathbf{p}_B, t) = f^{CG} + \sum_{l=1}^{L_{max}} \sum_{m=-l}^l f_l^m Y_l^m(\theta, \phi)$ θ, ϕ : Dec, R.A.

$$N_{param.} = (L_{max} + 1)^2 - 1 \quad (= 440 \text{ for } L_{max} = 20)$$

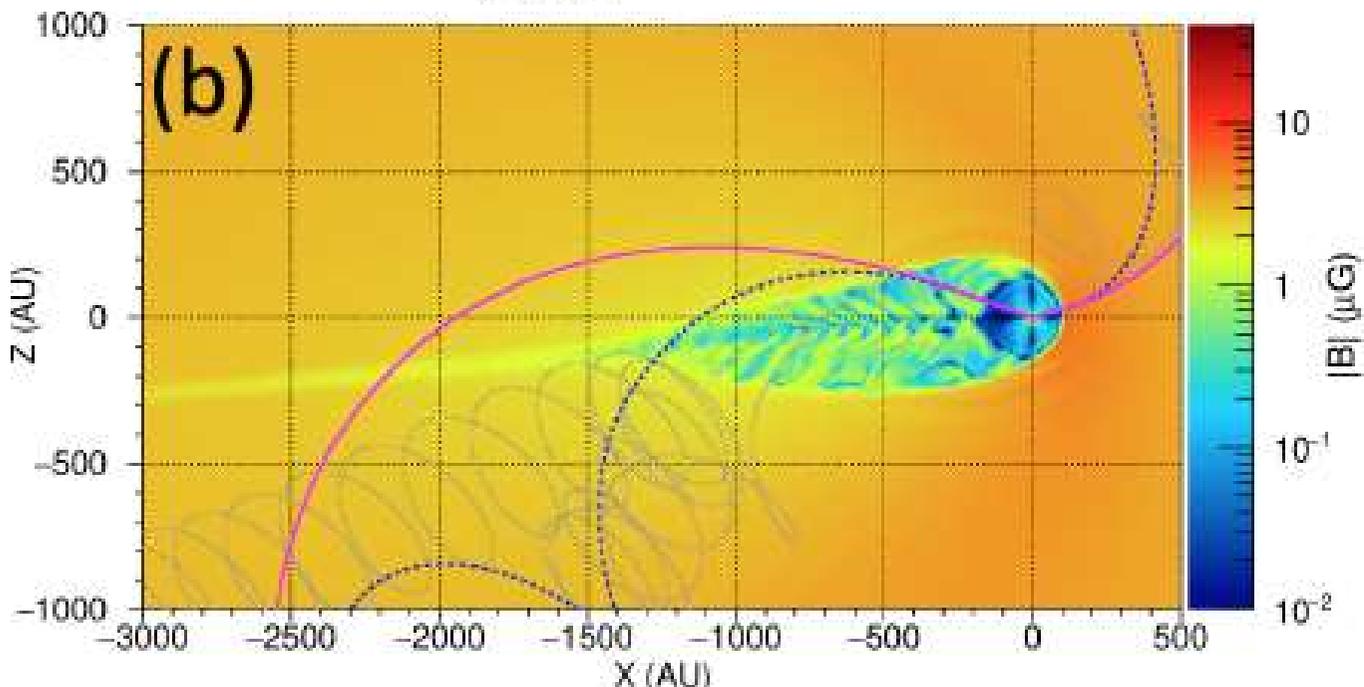

MHD boundary

仮定しているLISMからのズレが...

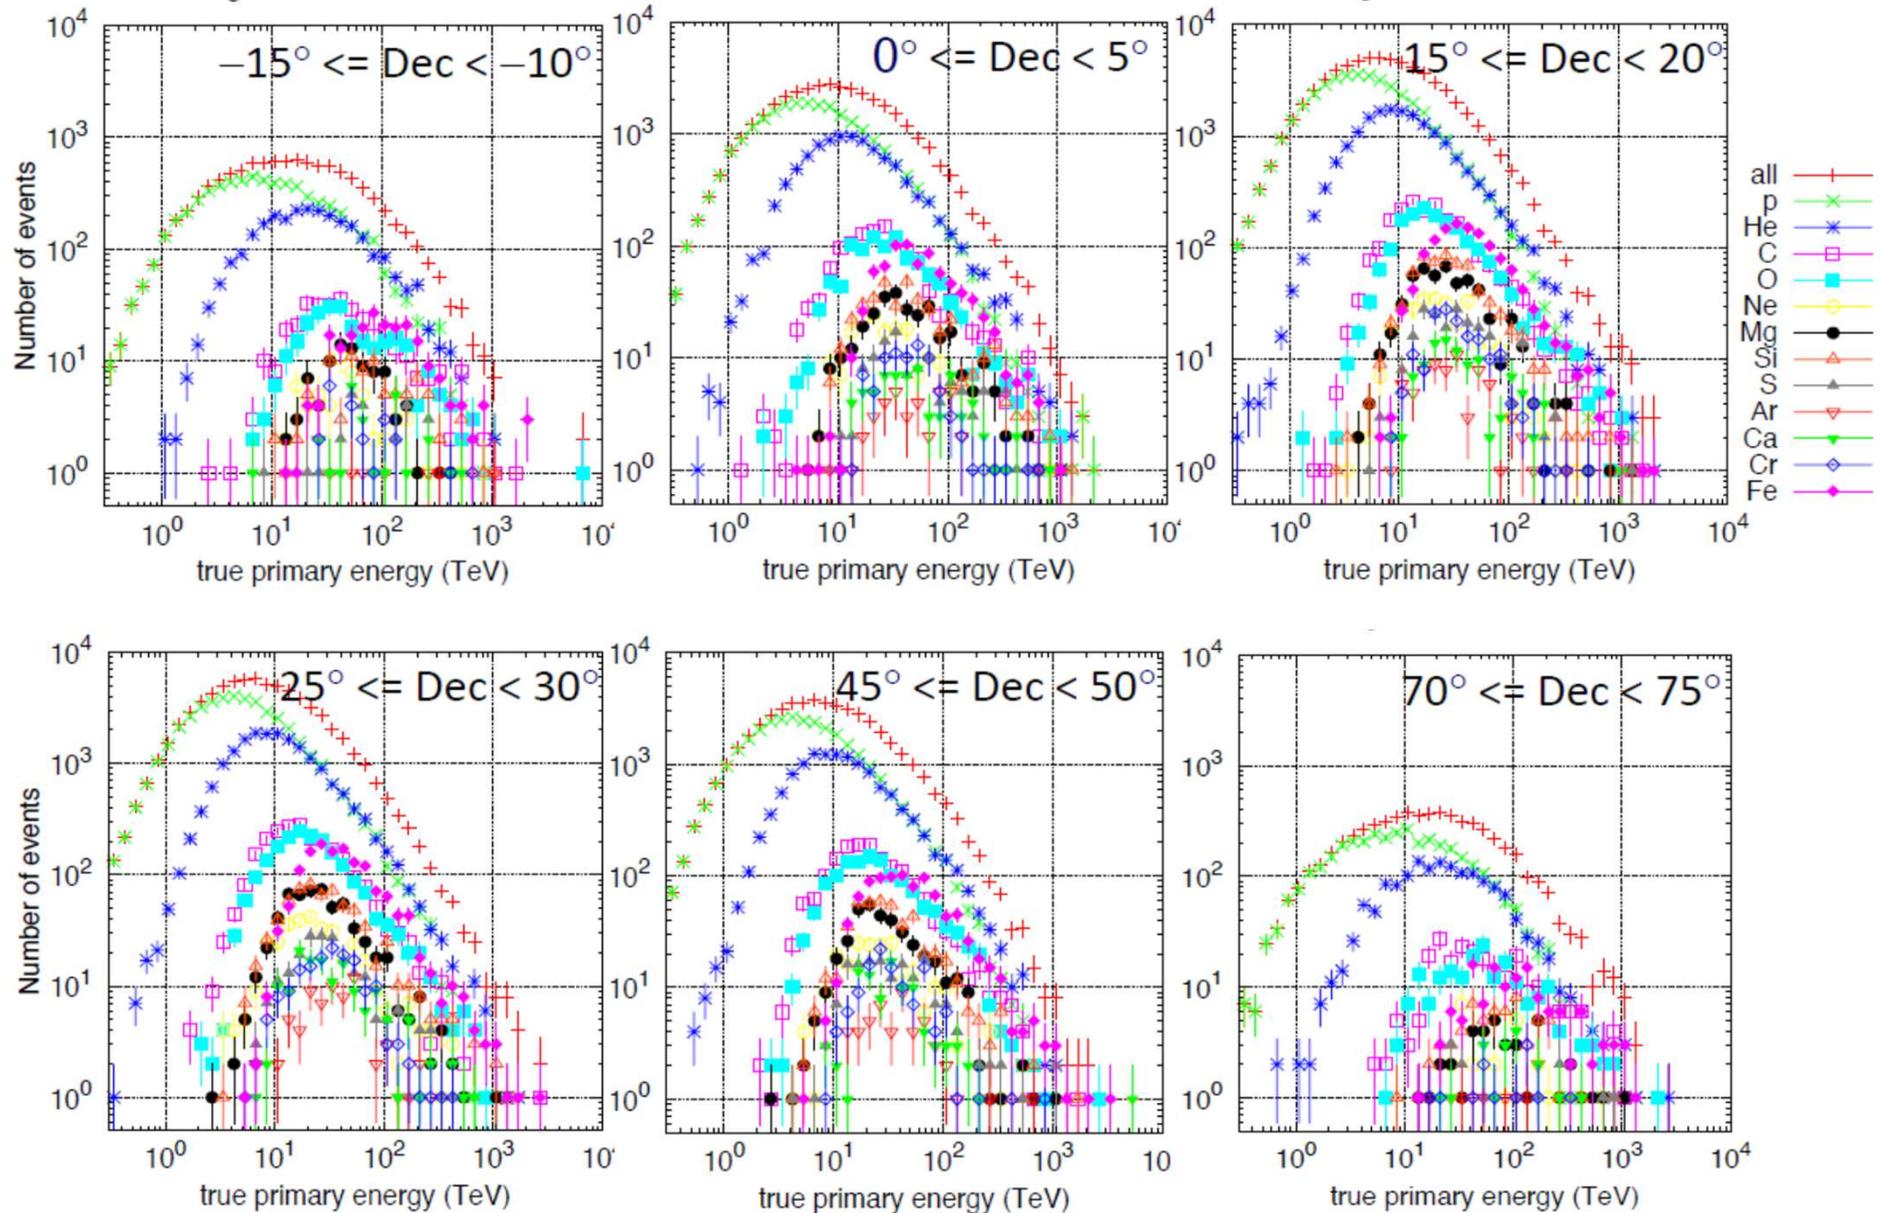

- 磁力線の向きで 1° 以内
- 磁場強度の絶対値で1%以下

...に収まる最も内側の面としてOuter boundary (黒線)を定義している。

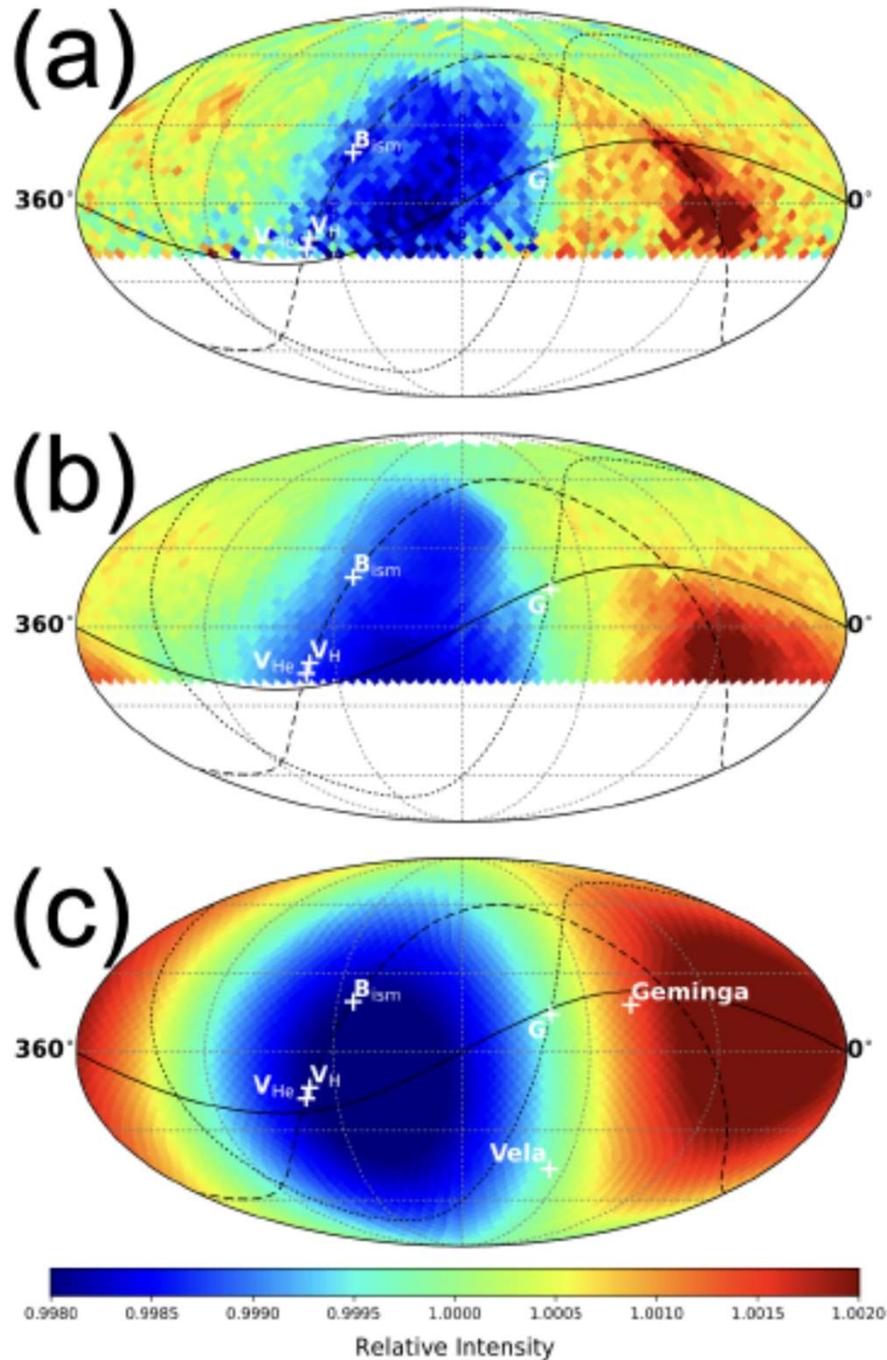

例として、地球からnose方向とtail方向に打ち出された、3.5 TV、7.1 TV、14 TVの反粒子の軌道がプロットしてある。

Weighting with composition & E-spectra by MC (instead of using monochromatic protons)

Best-fit results

Assuming a **free dipole anisotropy** plus **bidirectional flow** along the LISM

		Best-fit values	
		this work	Paper 1
	$A_{1\parallel}$	$(0.234 \pm 0.002)\%$	$(0.165 \pm 0.002)\%$
	$A_{2\parallel}$	$(0.011 \pm 0.005)\%$	$(0.015 \pm 0.002)\%$
	$A_{1\perp}$	$(0.131 \pm 0.006)\%$	$(0.021 \pm 0.001)\%$
Parameters	α_{\perp}	$193.1^{\circ} \pm 7.9^{\circ}$	$287^{\circ\ddagger}$
	δ_{\perp}	$-66.0^{\circ} \pm 2.4^{\circ}$	$-59^{\circ\ddagger}$
	α_G	$137.5^{\circ} \pm 1.4^{\circ}$	$151^{\circ\ddagger}$

$\chi^2/\text{d.o.f.}$		1.62	4.5

Results: fitting by spherical harmonics

$$I_{ISM}(\theta, \phi) = 1 + \sum_{l=1}^{l_{\max}} \sum_{m=-l}^l f_{lm} Y_{lm}(\theta, \phi) + I_{CG}$$

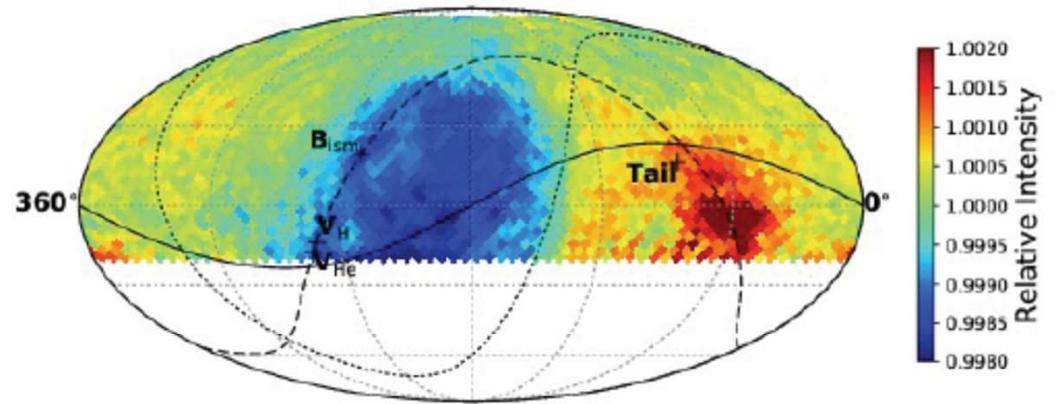

$L_{\max} = 24$ (624 parameters)

Data @ Earth

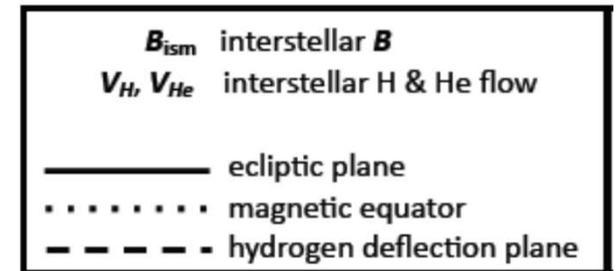

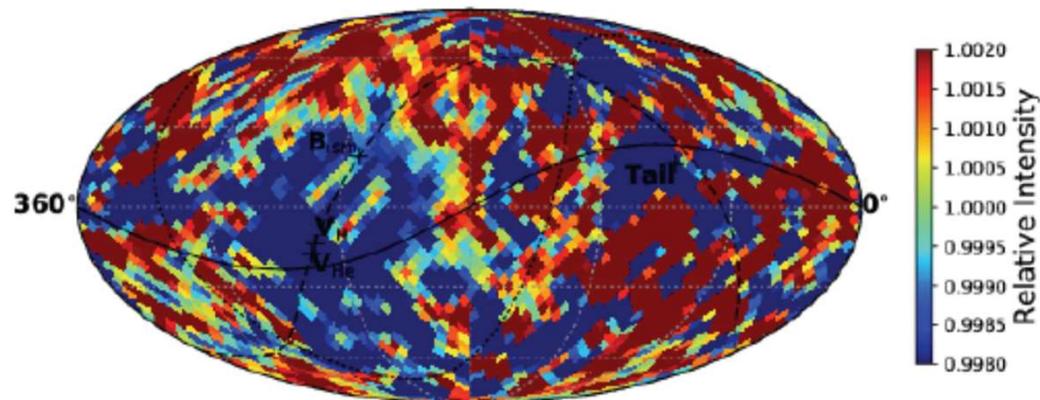

$\chi^2 / \text{ndf} = 1393 / 1432 = 0.973$ (76.4 %)

Model Fitting @ Earth

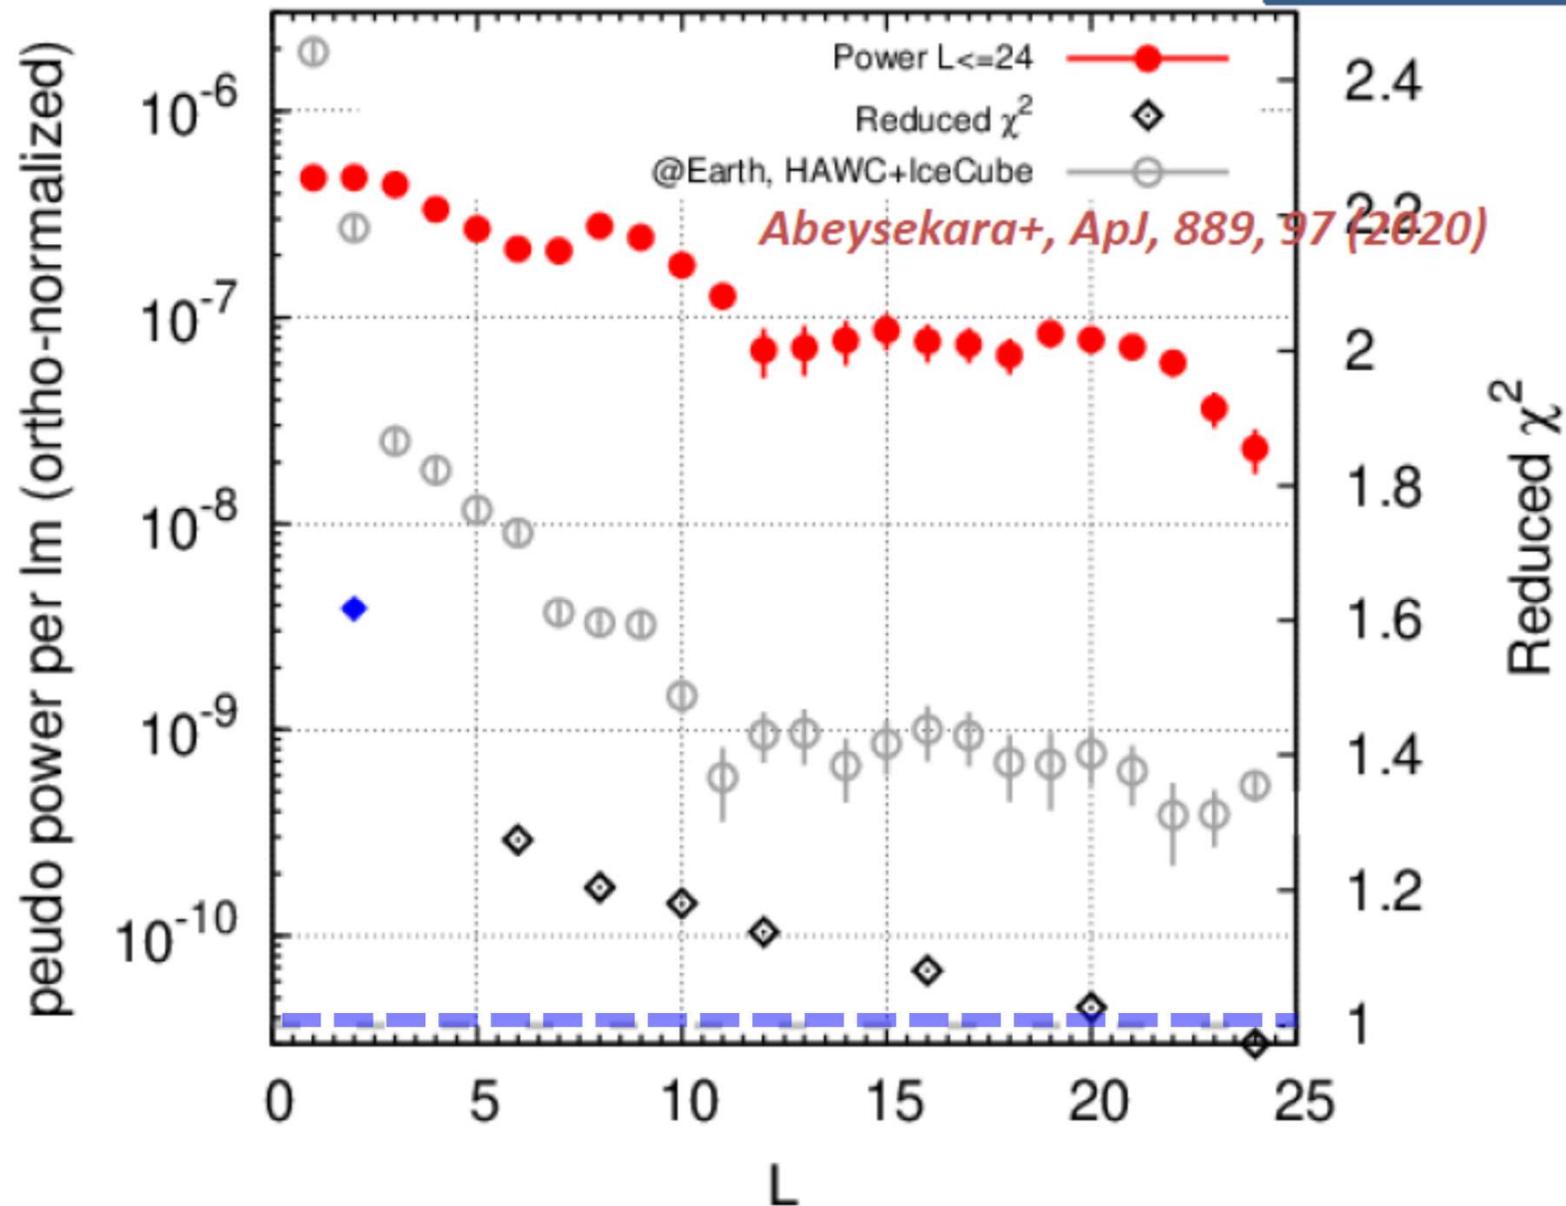

Model @ Boundary

➤ Unrealistic small-scale anisotropy appears @ outer boundary

Results: Power spectrum

$$C_l = \left(\frac{1}{4\pi}\right) \left(\frac{1}{2l+1}\right) \sum_{m=-l}^l f_{lm}^2$$

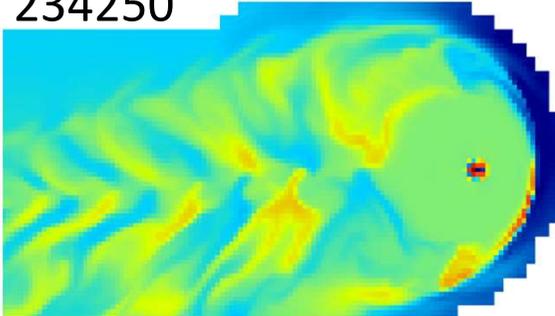

- $L \geq 20$ terms are needed @ outer boundary to get reasonable χ^2
- Spectrum flatter @ outer boundary than @ Earth

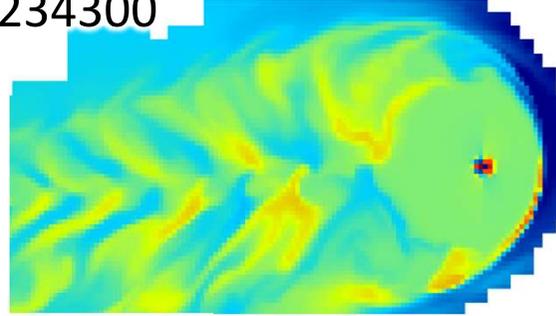

Using 12 MHD snap shots

Corresponding to 10-year observation by Tibet in $A < 0$ epoch

power spectrum

Summary

- 観測される宇宙線のリジディティ・スペクトラムを考慮することにより、reduced χ^2 を大幅に下げることが出来た(4 parameter-fit で、4.5→1.6 d.o.f.=2052)。
- Outer boundary上の異方性のpower spectrumでは微細な異方性が卓越しており、reduced χ^2 を1程度にまで下げるためには、 $L \sim 20$ 程度までの高次の異方性が必要であった。
- 観測期間(約10年間)に対応する12個のMHD-snap shotを軌道計算に用いると、上の問題に一部改善が見られたが、依然として $L \geq 3$ の高次異方性が卓越している。
- 今後、ここまでの結果を論文にまとめて公表したい。
